**Modern technologies and solutions
to support European Cities**

Abstract

1. What is EiT? How EiT Urban Mobility can contribute to innovation in European Cities.
2. Internet of Things on the city field
Will the innovative solution, which is currently being tested on two different fields, prove itself in the real world? The assumptions and preliminary results of the ongoing pilot installations will be presented.
3. Consolidation hub for the city center as solution for cargo traffic overload
Truck transport in city centers, especially historic ones, can be a nightmare. Consolidation of supplies creates a real chance to improve this situation, but it faces some limitations. It is necessary to achieve a balance between the profits for the urban environment and the expenses of business.
